PROFESSIONAL SUMMARY

Full-Stack Software Engineer with 5+ years of backend experience in PHP/Laravel, Node.js and MySQL and 3+ years of React/TypeScript, building a multi-tenant SaaS used by 100+ enterprise clients. Hands-on with REST APIs, Node.js services, Redux, React Native, Docker, AWS and Linux, with working experience of microservices, RabbitMQ and SLO-based monitoring. Made reports up to 85% faster, cut production issue resolution time by 65% and contributed to 27% company revenue growth.

A team player who writes technical specs, breaks large features into small, testable pieces and works closely with product, UX and international clients. Passionate about platform reliability, infrastructure automation, and observability, and currently expanding into Go, system design, and SRE practices. I enjoy turning complex, high-traffic systems into fast, stable, and easy-to-maintain platforms.

TECHNICAL SKILLS

Languages: PHP, JavaScript (ES6+), TypeScript, SQL, Python

Backend: Laravel, Node.js, Express.js, NestJS (learning), FastAPI, REST APIs, SOAP, Webhooks, Queues and Background Jobs

Frontend: React.js, Redux Toolkit, Next.js, React Native, TypeScript, HTML5, CSS3, SASS/LESS, Ant Design, Bootstrap, Vue.js, Figma handoff

Databases: MySQL (indexing, query optimization, data modeling), MongoDB, Redis

Architecture: Microservices, Event-Driven (RabbitMQ, Kafka basics), Multi-Tenant SaaS, RBAC

DevOps and Tools: Git, Linux (Ubuntu, Debian), Docker, Docker Compose, CI/CD, AWS, AWS CloudWatch, Nginx, Kubernetes (familiar)

Testing and Monitoring: PHPUnit, pytest, Postman, TDD, SLIs/SLOs, APM, Grafana/Prometheus, Laravel Telescope, structured logging, alerting

AI-Assisted Development: Claude Code, multi-agent workflows, AI-assisted code review, testing and documentation

PROFESSIONAL EXPERIENCE

Software Engineer | Sokrio | Dhaka, Bangladesh

2023 – Present

Multi-tenant distribution, supply chain and order management SaaS serving 100+ enterprise clients across 40+ industries.

- **REST APIs for mobile and integrations:** Designed the REST APIs behind the mobile field-force app and contributed React Native screens and fixes to it, plus SOAP endpoints and queue-based sync for legacy enterprise clients; troubleshoot integration issues directly with client teams.
- **Node.js services:** Built Node.js/Express services, background workers and developer tooling alongside the Laravel core API, in JavaScript and TypeScript.
- **Frontend modernization:** Led the Vue.js to React, Next.js, Redux Toolkit and TypeScript (SASS) rewrite in 2 months, rebuilt key user journeys from Figma designs with UX designers and product stakeholders, and set the component, folder-structure and code-review standards the team adopted. User engagement rose 30%.
- **MySQL optimization:** Tuned MySQL with composite indexes, EXPLAIN analysis and N+1 elimination; moved heavy reads to MongoDB; designed a polymorphic entity-mapping model and row/cell-level bulk-import validation.
- **Reporting and performance:** Built heavy reports over millions of records using MongoDB aggregation pipelines, Laravel queue jobs (retries, dead-letter queues, priority jobs) and Redis caching, cutting report load times by up to 85% with 99.9%+ report-generation uptime.
- **Microservices migration:** Led the migration of a Laravel 8/Vue.js 2 monolith to an event-driven microservices platform: Laravel core REST API, separate React tenant and admin apps, and Report, Notification and SOP services communicating over RabbitMQ, with MongoDB and Redis. Ran both systems in parallel for a zero-downtime cutover, cutting server load by about 20%.

- **Observability, SLIs/SLOs and on-call:** Primary 24/7 on-call engineer for six production apps; tracked SLIs/SLOs (99.9% report-generation availability, API latency and error rate) with APM, Grafana/Prometheus dashboards, AWS CloudWatch, Laravel Telescope and structured logging, with SLO-based alerts; cut issue resolution time by 65%.
- **Multi-tenancy and security:** Built landlord/tenant database isolation, tenant-scoped queries and territory-scoped role-based access control (RBAC) from scratch, with zero cross-tenant data leakage across 100+ tenants.
- **Technical specifications and collaboration:** Wrote technical specifications and phased dev plans (data model, API contract, UI flow, test plan) before each module, and worked with international clients and distributed and offshore teams via English async communication (Slack, Jira, PR reviews, docs).
- **Field force and van sales:** Built Task Manager (plan, approval, achievement tracking), Van Sales, Vehicle Feedback and Van Attendance modules with real-time sync to the core platform, plus GPS-spoofing fraud detection, contributing to 27% company revenue growth.
- **Payments:** Designed the payment gateway integration for billing and subscriptions: initiation, webhooks, retries, auto-reconciliation and receipts, secured with HMAC signature verification and idempotency keys, with zero failed transactions in production.
- **Docker and CI/CD:** Containerized services with Docker and built CI/CD pipelines for automated testing and deployment, making deployments about 40% faster with no environment-mismatch incidents.
- **Testing:** Wrote tests first for new service and API logic with PHPUnit and pytest, and made tests a required phase of every feature, so regressions were caught in CI instead of production.
- **AI-assisted engineering:** Use Claude Code daily for code generation, review, debugging and docs, with a custom setup of skills and sub-agents for database, backend, frontend and test work to deliver tested features faster.

Junior Software Engineer | SoftArch | Dhaka, Bangladesh

May 2022 – May 2023

- Built GirlyShopper, a multi-store e-commerce platform (Laravel, Vue.js, MySQL) with Point of Sale (POS) integration, barcode inventory and real-time stock tracking, cutting manual stock reconciliation by about 60%.
- Integrated card, bKash, Nagad and cash-on-delivery payments with webhook-driven order status updates, plus wishlists, persistent cart and real-time stock checks.
- Built a grocery delivery platform with multi-store inventory, advance orders and MySQL tuning for peak volumes.
- Managed Linux (Ubuntu/Debian) VPS servers for multiple production apps and set up Dockerized CI/CD pipelines (lint, test, deploy on every push) for zero-downtime releases.

Software Engineer | Am Coders | Dhaka, Bangladesh

Feb 2021 – Apr 2022

- Designed, built and shipped a multi-tenant SaaS product sold on the CodeCanyon marketplace, with RBAC, a REST API and a Vue.js frontend.
- Integrated payment gateways with a full subscription lifecycle (trial, renewal, cancellation), HMAC-verified payment webhooks and encrypted billing storage.
- Handled buyer bug reports and support, usually resolving issues within 24 hours; promoted from intern to Software Engineer within 1 month.

PROJECTS AND RESEARCH

- **Supply Chain Distribution System:** Node.js, Express.js and React.js platform that manages products, customers and orders through RESTful APIs.
- **Research (submitted, under review):** Emotion Detection from Customer Reviews using LLMs, Sentiment Analysis and NLP; Bangladesh Suicide Case Pattern Analysis using Statistical Analysis and Data Mining.

EDUCATION AND CERTIFICATIONS

Bachelor of Science in Computer Science and Engineering

2022 – 2025

Bangladesh University of Business and Technology (BUBT), Dhaka

Diploma in Engineering, Data Telecommunication and Networking

2016 – 2020

Feni Computer Institute, Feni

Courses and Certifications: AWS Fundamentals (2025) | Problem Solving and Data Structures (2023) | Frontend Development with React.js and Next.js (2022) | Software Engineering Fundamentals (2020)
